Name: G. Y. Sharindi

Registration Number: 2022/ICT/89

Mission & Objectives

Problem Statement

Job seekers face difficulty finding local opportunities due to broad city-based filtering on traditional platforms, leading to commuting overheads.

Proposed Solution

A proximity-aware MERN stack hub enabling employers to tag specific regional branches via string-based location mapping.

Key Project Goal

To create a frictionless, real-time interface for local recruitment using modern cloud data structures without complex configuration overheads.

Technical Ecosystem

Node.js & Express

Asynchronous runtime environment for custom API routes.

MongoDB Atlas

Cloud NoSQL cluster storing job documents flexibly.

React.js

Renders high-speed Single Page Applications dynamically.

HTML & CSS

Semantic layout structure bundled with custom viewports.

Docker

Container images for consistent environment deployment.

Postman & Git

Comprehensive API endpoint testing and version management.

Backend Architecture (MVC)

We followed the **Model-View-Controller** pattern to ensure security and code maintainability across development lifecycles:

- **Models:** Database schema declarations handling object parameters.
- **Controllers:** Functional runtime core carrying explicit logic scripts.
- **Routes:** Maps structural incoming requests safely to controllers.
- **server.js:** Central server initialization module.

Workspace Benefits

Separation of files ensures that updating frontend client requests doesn't compromise core backend controller integrity.

Cloud Data Integration

Mongoose Connection

The server establishes permanent connections to MongoDB Atlas via an encrypted connection string.

Document Operations

Unlike regular databases, MongoDB handles properties like variable multi-location strings natively.

This allows rapid asynchronous retrieval when clients query matching proximity records.

API Operations Layer

Operation	HTTP Method	Project Purpose
Fetch All Jobs	GET	Populates the main interface dashboard stream automatically.
Add New Vacancy	POST	Allows employers to inject active job parameters to the cloud.
Update Parameters	PUT	Modifies target object variables using distinct ID references.
Remove Vacancy	DELETE	Flushes outdated documents safely out of the cluster.

System Showcase: Discovery UI

Demonstrates smooth transition from base discovery streams to focused proximity listings on the client screen.

System Showcase: Application Flow

Graphic Designer
Not Specified

Location: Kandy
Salary: Rs. 60000

Required Qualifications:

- Excellent communication and problem-solving skills.
- Prior experience or relevant educational background for the role.
- Ability to work efficiently under local regional environments.

Description:
Expertise in Photoshop and Illustrator required.

Success!
Your application with personal details has been submitted successfully to the employer!

Awesome, Thank You!

Ensures full user behavioral closing feedback when records map completely down to the backend server collections.

Evaluation via Postman

Automated API integration routes were executed during production runs:

- **GET Evaluation:** Validated proper JSON array structures with a 200 OK trigger response.
- **POST Serialization:** Checked target payload constraints by appending custom role records securely.

Backend Stability

Passing unit route parameters safely guarantees database security and absolute interface synchronization during presentations.
